**MAFLD vs. MASLD: Consensus is unlike evidence!**

1 We read with interest the study by Pan *et al.*, demonstrating that  
2 metabolic dysfunction associated fatty liver disease (MAFLD) is super-  
3 prior to metabolic dysfunction associated steatotic liver disease  
4 (MASLD) in identifying individuals at risk of chronic kidney disease  
5 [1]. The study extends recent similar findings showed that MAFLD is  
6 better than MASLD identifying metabolic dysfunction, hepatic and  
7 extra-hepatic outcomes [2-4].

8 These findings beg an interesting question, why the MASLD defi-  
9 nition, which came second after MAFLD, failed to provide a concep-  
10 tual advance. Although the actual causes may be not clear, a key  
11 obvious cause is consensus is unlike evidence. The MASLD proposal is  
12 grounded on a questionnaire of personal views that might be heavily  
13 compounded by various types of conflict of interests and could be  
14 influenced by the view of few but vocal participants in this consensus  
15 process. Additionally, it is crucial to realise scientific truth is about  
16 evidence not consensus alone and in many circumstances the expert  
17 opinions turned to be not the same as evidence-based data [5]. A  
18 recent analysis of over a hundred consensus demonstrates that the  
19 rigor of statement development in consensus statements is less than  
20 one-third of that of evidence-based guidelines [6].

21 Notably, when the metabolic dysfunction associated fatty liver  
22 disease (MAFLD) revolutionary proposal was introduced [7,8], the  
23 opponents raised multiple concerns. One of the key concerns that  
24 was raised by Moreno *et al.*, on behalf of the EASL Consortium for the  
25 Study of Alcohol-related LiVer disease in Europe (SALVE) that in a  
26 patient satisfying criteria for MAFLD but with another risk factor  
27 including alcohol intake, the term “dual-aetiology fatty liver disease”  
28 [9]. They went very heavily to suggest that this would lead to separa-  
29 ting individuals exposed to alcohol consumption into two categories  
30 (ALD for individuals with normal weight and dual etiology fatty liver  
31 disease for overweight or obese individuals) and that patients satisfy-  
32 ing metabolic risk criteria would no longer be recorded as having  
33 ALD. This could lead to overlooking the importance of the amount of  
34 alcohol consumption on fibrosis and the importance of reductions in  
35 alcohol consumption to outcomes and could impact the funding of  
36 alcohol research [9].

37 However, the MAFLD proposal dealt carefully with these aspects  
38 by suggesting “dual-etiology” as a “concept” and not a “term”. This  
39 concept encompasses patients with MAFLD and ALD as well as those  
40 of MAFLD with other aetiologies as chronic hepatitis B or C. [10] How-  
41 ever, the fundamental and logic question where these concerns went  
42 with the proposal of “metALD” that introduced an actual term not  
43 just a concept? This term separates patients with ALD, with the vast  
44 majority of ALD patients would now be labelled as MetALD.

45 Similarly, we recently raised concerns on how the change of F to S  
46 from fatty to steatotic addressed all concerns that were raised in the  
47 popular editorial that was published raising doubts on the potential

negative impact of the premature change from NAFLD to MAFLD on 48  
various aspects including epidemiology, noninvasive score perfor- 49  
mance and clinical trials [11]. It is not clear why suddenly the prema- 50  
ture became mature [12]. 51

Another striking example, I bet every researcher in the field who 52  
submitted a manuscript over the last few years using the MAFLD 53  
term has encountered comment that “you cannot use MAFLD to 54  
describe data generated under the NAFLD term”. Therefore, again 55  
how it became not only OK but encouraged and sometimes forced to 56  
use data generated under the NAFLD term using the MASLD term. 57

In total, “You can hide memories, but you can’t erase history that 58  
produced them”. Let the evidence not opinion guide our path, as 59  
unbiased evidence is a self-fulfilling guarantee that the evidence will 60  
not be affected by conflicts of interest. More studies as the current 61  
study [1] are required to generate evidence-based recommendations. 62

**Funding**

There has been no kind of support for this manuscript by any 64  
source. 65

**Author contribution**

YF and EK were involved in the conceptualization, and writing the 67  
original draft while All authors revised the original draft, added com- 68  
ments, and approved the final draft. 69

**Declaration of competing interest**

The authors have nothing to disclose. 71
