1. Summary of the clinical history (A-11-08)

This is the case of an 11-year-old male patient with jaundice, drowsiness and vomiting.

1.1. Family history

The mother is 28 years of age and did not complete primary education. She is a housewife, Catholic and healthy. Father is a 31-year-old peasant with incomplete primary schooling.

1.2. Past history

The family is originally from and reside in the state of Hidalgo in a rural environment. They speak Nahuatl language and are from a low socioeconomic status. They cook with firewood, coexist with poultry, and the home is without electricity, drinking water or sewerage system.

Nutrition. The patient was breastfed until 1 year of age and later integrated into the family diet based on corn tortillas and beans. Denied eating wild mushrooms.

Psychomotor development. The patient walked at 18 months, had sphincter control at 24 months, and repeated the second grade in school.

Immunizations. Incomplete, lacked influenza and hepatitis B vaccines.

1.3. Perinatal and medical history

The patient was the product of a GIII. The mother received prenatal care from the fifth month of gestation. There were no complications during pregnancy. She did not consume folic acid or iron. Labor was without complications and the mother was cared for in the rural medical center. The infant cried and breathed at birth; weight, height and Apgar score are unknown. Denied allergies, surgeries, trauma, transfusions or prior hospitalizations.

1.4. Current problem

From January 1 to February 4, 2011 the patient was hospitalized in a second-level hospital due to sudden onset of icterus, which was progressive, cephalocaudal,
